

UML LABORATORY EXPERIMENTS

Questions, Aims, Results & Diagram Placeholders
Experiments 1–30

Name	Rashmi Naurene
Register No.	192521357
Class / Section	Slot-B

Experiment 1: Passport Management System

Question

Develop a system using UML for Passport Management System. It should verify the passport details of the applicant by the central computer. The details regarding the passport will be provided to the central computer and the computer will verify the details of the applicant and provide approval to the office. Then the passport will issue from the office to the applicant.

Aim

To develop and model the Passport Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Passport Management System was developed successfully, representing the required system processes and interactions.

Experiment 2: Book Bank Process

Question

Develop a system using UML for implementing the Book Bank process. It should verify the details of the student by the central computer. The details regarding the student will be provided to the central computer through the administrator in the book bank and the computer will verify the details of the student and provide approval to the office. Then the books that are needed by the student will issue from the office to him.

Aim

To develop and model the Book Bank Process using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Book Bank Process was developed successfully, representing the required system processes and interactions.

Experiment 3: Exam Registration Portal

Question

Develop a system using UML for implementing the Exam Registration Portal. It should verify the details of the candidate by the central computer. The details regarding the candidate will be provided to the central computer through the administrator and the computer will verify the details of the candidate and provide approval. Then the hall ticket will be issued from the office to the candidate.

Aim

To develop and model the Exam Registration Portal using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Exam Registration Portal was developed successfully, representing the required system processes and interactions.

Experiment 4: Stock Maintenance System

Question

Develop a system using UML for implementing Stock Maintenance System. In this system, the customer can place orders and purchase items with the aid of the stock dealer and central stock system. These orders are verified and the items are delivered to the customer. Then the stock details are to be updated accordingly.

Aim

To develop and model the Stock Maintenance System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Stock Maintenance System was developed successfully, representing the required system processes and interactions.

Experiment 5: Online Course Reservation System

Question

Develop a system using UML for implementing Online Course Reservation System. This system is organized by the central management system. The student first browses and selects the desired course of their choice. The university then checks the availability of the seat if it is available the student is enrolled for the course.

Aim

To develop and model the Online Course Reservation System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image Diagram

Result

Thus, the UML model for the Online Course Reservation System was developed successfully, representing the required system processes and interactions.

Experiment 6: E-Ticketing System

Question

Develop a system using UML for implementing E-Ticketing System. This is to be used by the passenger for reserving the tickets for their travel. This E-ticketing is organized by the central system. The information is provided by the railway reservation system.

Aim

To develop and model the E-Ticketing System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Diagram

e-ticketing deployment diagram

e-ticketing class diagram

Result

Thus, the UML model for the E-Ticketing System was developed successfully, representing the required system processes and interactions.

Experiment 7: Credit Card Processing System

Question

Develop a system using UML for implementing Credit Card Processing System. In this system, the cardholder can purchase items and pays the bill with the aid of a credit card. The cashier should accept the card and proceed with the transaction using the central system. The bill is to be verified and the items are delivered to the cardholder based on it.

Aim

To develop and model the Credit Card Processing System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Diagram

Result

Thus, the UML model for the Credit Card Processing System was developed successfully, representing the required system processes and interactions.

Experiment 8: Software Personnel Management System

Question

Develop a system using UML for Software Personnel Management System. It should be used to process the details of a person who works in a software company. The details are to be stored in the central management system for cross-checking the person's details.

Aim

To develop and model the Software Personnel Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Software Personnel Management System was developed successfully, representing the required system processes and interactions.

Experiment 9: E-Book Management System

Question

Develop a system using UML for E-Book Management System. It should be designed to manage the books that were read through the internet. That should consist of the details of the e-book that were read by the user online. It will be controlled by the central system. This system should act as a backup of all details together.

Aim

To develop and model the E-Book Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the E-Book Management System was developed successfully, representing the required system processes and interactions.

Experiment 10: Recruitment System

Question

Develop a system using UML for Recruitment System, to recruit the applicant for a particular job in the company. It was controlled by the central management system to manage the details of the particular applicant who has to be recruited by a company.

Aim

To develop and model the Recruitment System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Recruitment System was developed successfully, representing the required system processes and interactions.

Experiment 11: Conference Management System

Question

Develop a system using UML for Conference Management System. It should manage the details of the process that will be taking place at the conference. It should work along with the organizer, who arranges the program and central management system, which consists of all the details of the member and the role he/she, who is going to participate in the presentation.

Aim

To develop and model the Conference Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Conference Management System was developed successfully, representing the required system processes and interactions.

Experiment 12: Foreign Trading System

Question

Develop a system using UML for Foreign Trading System, to maintain the details about the trading system that exists between the two countries. These details are to be held by the trading management system. The supplier and the customer will interact with the system.

Aim

To develop and model the Foreign Trading System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Foreign Trading System was developed successfully, representing the required system processes and interactions.

Experiment 13: BPO Management System

Question

Develop a system using UML for BPO Management System. The system should hold the details of the customer and all approaches to it. It is managed by the central system.

Aim

To develop and model the BPO Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the BPO Management System was developed successfully, representing the required system processes and interactions.

Experiment 14: E-Commerce Registration System

Question

Develop a system using UML for E-Commerce Registration System, to add customers. Then a catalog should be produced for the customer to add items to the cart. The return system should be included, to allow customers to return items within a specific time.

Aim

To develop and model the E-Commerce Registration System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the E-Commerce Registration System was developed successfully, representing the required system processes and interactions.

Experiment 15: Blood Bank Registration System

Question

Develop a system using UML for Blood Bank Registration System. The system should have the list of donors and the hospitals can check for the donor's availability and get their appointment. The donor and the hospital can interact with the central system.

Aim

To develop and model the Blood Bank Registration System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Blood Bank Registration System was developed successfully, representing the required system processes and interactions.

Experiment 16: Online Internship Registration System

Question

Develop a system using UML for Online Internship Registration System. It should verify the details of the candidate by the central computer. The details regarding the candidate will be provided to the central computer through the administrator and the computer will verify the details of the candidate and provide approval. Then the internship letter will be issued from the company to the candidate.

Aim

To develop and model the Online Internship Registration System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Online Internship Registration System was developed successfully, representing the required system processes and interactions.

Experiment 17: Vehicle Registration Number Registering System

Question

Develop a system using UML for Vehicle Registration Number Registering System. The owner should apply with the documents and pay the fee, once the documents had been accepted and the vehicle is verified. Then the document for registration is issued by the system.

Aim

To develop and model the Vehicle Registration Number Registering System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Vehicle Registration Number Registering System was developed successfully, representing the required system processes and interactions.

Experiment 18: Food Order System

Question

Develop a system using UML for Food Order System. In this system, the customer can place orders and purchase items with the aid of the dealer and central food system. These orders are verified and the items are delivered to the customer.

Aim

To develop and model the Food Order System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Food Order System was developed successfully, representing the required system processes and interactions.

Experiment 19: Home Services System

Question

Develop a system using UML for Home Services System. HACS is a system controlled by a remote system such as a mobile phone and coordinates home appliances. The document furnishes the detailed design with all the UML diagrams. It encompasses CRC cards, Use Case Diagrams, Sequence Diagrams, and Class Diagrams for home appliance control systems (HACS).

Aim

To develop and model the Home Services System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Home Services System was developed successfully, representing the required system processes and interactions.

Experiment 20: Library Management System

Question

Develop a system using UML for Library Management System. It should verify the details of the reader by the central computer. The details regarding the reader will be provided to the central computer through the administrator in the library and the computer will verify the details of the reader and provide approval to the office. Then the books that are needed by the reader will issue from the library to him.

Aim

To develop and model the Library Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Library Management System was developed successfully, representing the required system processes and interactions.

Experiment 21: Hospital Management System

Question

Develop a system using UML for Hospital Management System. The central system should manage patients’ and doctors’ appointments and case details. Also, include medical prescriptions and consultation fee details.

Aim

To develop and model the Hospital Management System using UML diagrams, representing the system’s actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Hospital Management System was developed successfully, representing the required system processes and interactions.

Experiment 22: Online Insurance Processing System

Question

Develop a system using UML for Online Insurance Processing System. The admin can create a category and sub-category, under which a new policy can be added. The user can view and buy the required policies. The system is managed by the Insurance Management System.

Aim

To develop and model the Online Insurance Processing System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Online Insurance Processing System was developed successfully, representing the required system processes and interactions.

Experiment 23: Online Shopping System

Question

Develop a system using UML for Online Shopping System. This system should represent the shopping system as well as its primary users, and roles. The logs of the transactions should be carried out for the shopping. The cart should be maintained before the purchase transaction.

Aim

To develop and model the Online Shopping System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Online Shopping System was developed successfully, representing the required system processes and interactions.

Experiment 24: Online Stock Market System

Question

Develop a system using UML for Online Stock Market System. This System facilitates its users the trade (i.e. buying and selling) stocks online. It allows clients to keep track of and execute their transactions of the different stocks in their portfolios. The central system should keep track of all the users, who interact with the system.

Aim

To develop and model the Online Stock Market System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Online Stock Market System was developed successfully, representing the required system processes and interactions.

Experiment 25: Online Voting System

Question

Develop a system using UML for Online Voting System. Registration of the new citizen and update can be done in the system. The process of initiating the polling. The voting was done from the citizen's end and the result publishing should be maintained by the admin.

Aim

To develop and model the Online Voting System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Online Voting System was developed successfully, representing the required system processes and interactions.

Experiment 26: Jewellery Shop Management System

Question

Develop a system using UML for Jewellery Shop Management System. The admin can add new customer detail and update the existing customer's detail. Whenever a customer made a purchase, it should reflect in the bill details as well as in the customer details. Also, the system should update the stock remained the shop.

Aim

To develop and model the Jewellery Shop Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Jewellery Shop Management System was developed successfully, representing the required system processes and interactions.

Experiment 27: Supermarket Management System

Question

Develop a system using UML for Supermarket Management System. The system should maintain the stock detail, employee detail, and customer details. The system should intimate the product with low stock and nearing the expiry date. The loyalty feature of the customers should be maintained. The offers to the customers should be based on their loyalty features.

Aim

To develop and model the Supermarket Management System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Supermarket Management System was developed successfully, representing the required system processes and interactions.

Experiment 28: Airplane Reservation System

Question

Develop a system using UML for Airplane Reservation System. The customer can search for flights for a given data and source/destination airport and reserve the required seats, the system should handle the payment. The customer can view flight schedules and cancel their reservation(s) if needed. Admin can add new aircraft, flights, and flight schedules. Admin can cancel any prescheduled flight and a notification should be sent to all stakeholders.

Aim

To develop and model the Airplane Reservation System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Airplane Reservation System was developed successfully, representing the required system processes and interactions.

Experiment 29: Bus Ticket Reservation System

Question

Develop a system using UML for the Bus ticket Reservation System. The customer can create a login and the details are stored by the system. The customer can view the bus and seat availability from source to destination on a given date and time. The customer can book tickets and view the status of the bus. The customer can cancel the ticket and a refund will be decided based on the time remaining before the departure of the bus.

Aim

To develop and model the Bus Ticket Reservation System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Bus Ticket Reservation System was developed successfully, representing the required system processes and interactions.

Experiment 30: Train Ticket Reservation System

Question

Develop a system using UML for the Train ticket Reservation System. The customer can create a login and the details are stored by the system. The customer can view the train and seat availability from source to destination on a given date and time. The customer can book tickets and view the status of the train. The customer can cancel the ticket and a refund will be decided based on the time remaining before the departure of the bus.

Aim

To develop and model the Train Ticket Reservation System using UML diagrams, representing the system's actors, activities, interactions, and structural relationships.

Image / Diagram Placeholder

Result

Thus, the UML model for the Train Ticket Reservation System was developed successfully, representing the required system processes and interactions.
